Work-Life Balance and Longevity

Top order channel
42.5%
Mobile App

Peak order window
Morning (6–12h)
~45k orders

Top age segment
25–34
~30k unique orders

Busiest day
Saturday
~14.5k orders

Mobile app dominates at
42.5%

Digital channels combine to
~50%

6-visit
customers are the mode

Most customers visit
5–7 times
and a long tail extends to 18

Suburban leads slightly
and all three location types are nearly equal

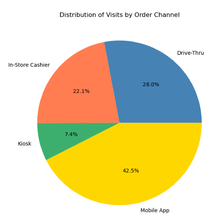
Perfectly uniform
across all 7 days with ~14% each

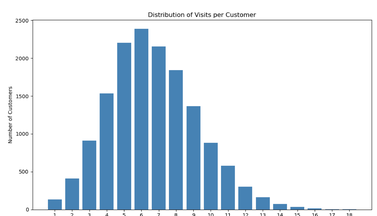
- Mobile App alone accounts for nearly half of all visits. Drive-Thru (28.0%) and In-Store Cashier (22.1%) split the physical channel share.
- Kiosk is the least-used at just 7.4%.
- Digital channels (Mobile + Kiosk) together represent ~50% of visits, signaling a meaningful shift away from traditional in-person ordering.

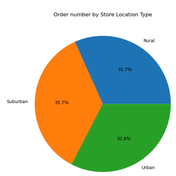
- The distribution peaks at 6 visits (~2,390 customers) and is roughly bell-shaped with a right skew.
- Very few customers visit only once (~130) or twice (~415), suggesting low one-time traffic.
- The tail beyond 10 visits (~1,750+ customers total) represents a high-value loyalist segment worth targeting with tiered rewards.

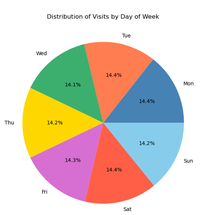
- Suburban stores account for 35.7% of orders, followed by Urban (32.6%) and Rural (31.7%).
- The near-even split is notable, it suggests the customer base is not concentrated in any one location archetype.
- Rural stores performing comparably to Urban ones may indicate strong drive-thru reliance outside cities.

- Mon, Tue, Fri, and Sat each show 14.4%; Thu and Sun show 14.2%; Wed shows 14.1%. The distribution is statistically flat, Starbucks customers show no meaningful weekday vs. weekend preference.
- This reinforces Figure 1: day of week is not a reliable lever for demand forecasting or targeted campaigns.









Morning (6–12h) is overwhelmingly dominant at
~45,000 orders

25–34 dominates
and order volume steadily declines with age

No meaningful gender difference
across any drink category

Saturday leads
but daily variation is minimal

- Morning accounts for more than all other time slots combined. Afternoon (12-17h) is a distant second (~30,500), followed by Early morning (0-6h) at ~12,700 and Evening (17-21h) at ~11,000.
- Night (21–24h) is nearly negligible (~1,000). This confirms Starbucks operates as a morning-first business (staffing, inventory, and promotions should be heavily weighted toward the 6-to-12h window).

- The 25-34 group generates ~30,000 unique orders, which is roughly 50% more than 35-44 (~24,500) and 3× that of the 55+ group (~10,000).
- The drop-off is consistent with each older cohort, suggesting either lower visit frequency or smaller population share.
- The 18-24 group (~20,400) sits second-lowest, possibly reflecting price sensitivity or less established coffee habits.

- Female and Male customers order all six categories at nearly identical volumes (~7,300–7,700 each).
- Tea shows a slight female lean (~5,900 Female vs. ~5,800 Male) but the gap is minimal.
- Gender is not a useful predictor of drink preference in this dataset, menu personalization by gender would not be warranted.

- Saturday has the highest order count (~14,500) and Monday follows closely.
- The spread across all 7 days is very narrow, roughly 14,200–14,500 orders, meaning demand is essentially flat throughout the week.
- Unique customer counts mirror this pattern, staying around 9,200–9,400 per day. There is no true "slow day" to exploit for promotions or staffing cuts.
